Main Page

From Dvd-game

Hi,

this is about a special piece of hardware from matshita.

It has a DebugMode.

DICommands

DriveVersions

CN302

PORTS

High-Level commands

Low-Level commands

Important memory locations

Threads

StateMachines

DiscLogin

Errorcodes

We hope you're all familiar with the concept of a Wiki (https://web.archive.org/web/20060829013254/http://en.wikipedia.org/wiki/Wiki)
Have fun then :p

Please note: I don't want this pages to become a "how-to-build-your-own-modchip". I want this to become a reference of the original firmware, nothing else. All this information contained here is public domain. Don't cry if somebody uses this information. Anyway it's fair to ask the people who did the work before using it.

For this reason, please don't post any (working) drivecodes here. Thanks.

(I'm just writing this as this page has become a bit more popular than it was intended originally. It's ok - i know how to setup a .htaccess, and i didn't do this on intent.)
